**RESEARCH INTERESTS** My research centers on the intersection of causality and machine learning. The overarching goal is to develop a methodology that models our world through a causality lens, capitalizing on shared causal mechanisms across diverse data environments. To achieve this, I use the language of *causal interventions* in a wide range of problems, including but not limited to unsupervised representation learning, causal structure learning, and the design of sequential interventions. More recently, my emphasis has been on causal representation learning from interventions, and exploring its potential applications.

## Causal Representation Learning from Interventions

- Designed a novel framework for analyzing causal representation learning via score functions under interventions. Established identifiability results along with probably correct algorithms.
- Published our results for general transformations at AISTATS [C4]. The manuscript for the results on linear transformations is submitted to JMLR [P2], and an earlier version is available in arXiv [P1].

## Intervention Design via Causal Bandits

- Designed causal bandit algorithms with relaxed assumptions compared to the prior work. Established lower and upper bound regret guarantees. Published one paper at JMLR [J1].

## Scalable Interventional Structure Learning

- Developed consistent algorithms for efficient learning of intervention targets and improving the structure learning of causal graphs.
- Published papers for both causally sufficient (NeurIPS [C2]) and causally insufficient systems (UAI [C3]).

## Structure Learning of Undirected Graphical Models

- Developed algorithms for structure learning of shared subgraphs for multiple undirected graphical models, and analyzed sample complexities. Published one paper at AISTATS [C1].
